DETAILED ACTION

Specification

1. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.
2. The specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification. Particularly, the specification must include a brief description of Figures 3a, 3b, and 3c, rather than a single brief description of Fig. 3 (there is no fig. 3 in the specification).

Drawings

3. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the eccentric element being formed directly on the rotor (Claim 10) must be shown or the feature canceled from the claim. No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 112

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

5. Claims 5 and 6 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 5 recites the limitation "the inside width". Claim 6 recites the limitation "the housing part". There is insufficient antecedent basis for these limitations in the claims.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

7. Claims 1, 2, and 7-10 are rejected under 35 U.S.C. 102(b) as being anticipated by Seidou (US 5,479,058). Seidou teaches a motor/gear unit with an electric drive 21 for rotor 24 with an eccentric element and wheel gear 26 and a driver 27, further having a guide bolt 29 to assure the eccentric motor and undesired rotation. The eccentric wheel gear being inside the motor rotor.

Claim Rejections - 35 USC § 103

8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

9. Claims 3, 4, and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Seidou (US 5,479,058) and Brucken (US 3,167,409). Seidou teaches every aspect of the invention except the guide bolt on the housing. Brucken teaches the guide bolt on the housing between the gears and the drive. It would have been obvious to a person of ordinary skill in the art at the time of the invention to construct the drive motor of Seidou with the guide pins on the housing as in Brucken to stabilize the gears and prevent free rotation.

10. Claim 5 rejected under 35 U.S.C. 103(a) as being unpatentable over Seidou (US 5,479,058) and Brucken (US 3,167,409). Seidou and Brucken teach every aspect of the invention except the width of the recess being twice the eccentricity of the eccentric element. It would have been obvious to a person of ordinary skill in the art at the time of the invention to construct the drive motor of Seidou and Brucken with the width of the recess being twice the eccentricity of the eccentric element to optimize the performance of the reduction gears (See *In re Aller*, 105 USPQ 233, holding where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art).
